587 It may be noted that this custom may conflict with the other custom, previously mentioned, that a woman objects to marrying a man younger than herself. In the case mentioned by Mr Man a young man was compelled to marry a woman who was considerably his senior[1].

I believe that, in connection with, or underlying this custom there was an objection against a widow marrying a man who was older than her former husband (and who would therefore be his *ot-otoatue*). I regret that I cannot speak with certainty on these matters.

854 We may turn now to the duties to one another of parents and children. During their infancy the children are in the care of the mother. Children are, however, such favourites with the Andamanese that a child is played with and petted and nursed not only by his own father and mother but by everyone in the village. A woman with an unweaned child will often give suck [853] to the children of other women. Babies are not weaned till they are three or four years old.

[482] Before the children can walk, they are carried about by the mother, and sometimes by the father or other persons, in a bark sling (called *čiba* in *Aka-Jeru*), which is shown in Plate XIV.

857 After they can walk the children generally accompany their mothers in their expeditions near the camp for firewood or vegetables. When they are not with their mothers they amuse themselves with games in the village or on the beach. All the children of the coast villages learn to swim when they are very young, in fact almost as soon as they learn to walk, and many of their games are conducted in the water.

868 When a boy reaches the age of five or six his father makes him a toy bow and arrows, and sometimes a toy canoe. From this time the boy begins to learn the occupations of men and begins to pick up knowledge about the animals and trees and fishes of his country. The girl, accompanying her mother on her expeditions to gather roots and seeds, or to catch fish or pick up molluscs on the reefs, learns what it is necessary for women to know.

855 Until the age of about eight to ten a child lives with his

abstentions and ceremonies does have a very powerful emotional effect on the youth or girl may be readily observed by an eye-witness; that their permanent effect is to create in his or her mind a number of sentiments that previously existed not at all or only in an undeveloped condition will be shown in the course of the present argument. 182X 881 262

Since in the life of the Andamans by far the most important social activity is the getting of food, and it is in connection with food that the social sentiments are most frequently called into action, it is therefore appropriate that it should be through his relation to food that the child should be taught his relation to the society, and thus have those sentiments implanted in him or brought to the necessary degree of strength. During his infancy the child is almost entirely unrestrained and acts with great comparative freedom. [853] He does not realise, in any adequate manner, that the food with which he is freely provided (for children are the last to suffer hunger) is only obtained by skill and effort, nor does he realise that he will one day be required to labour to supply food for others. There follows a period of restraint, during which the growing boy or girl has to give up eating certain relished foods, and has to pass through a number of ceremonies, some of them painful, and all solemn and awe-inspiring. These restraints on the action of the individual are not imposed by one person, but by the whole society backed by the whole force of tradition. Through a series of years, just at what is, for physiological reasons, the most impressionable age, the individual learns to subordinate his own desires to the requirements of the society or of custom, as explained to him by his elders. He is thus impressed, in a forcible manner, with the importance of the moral law, and at the same time he is impressed with a sense of the social value of food. The ceremonies thus afford a moral education adapted to the requirements of life as it is lived in the Andamans. It would need a very lengthy analysis to show all the effects of the ceremonies on the emotional life of those who undergo them, and for the purpose of this chapter such an analysis is unnecessary. It will suffice merely to mention a few of the more important. As stated above, the ceremonies teach the boy or girl self-control or self-restraint, and they do so in relation to one of the two

not at the hands of their mothers, but of the male members of the tribe.

Reproduction.—1. Marriages never take place till both parties have attained maturity, and generally not till a few years later; the usual age of the bridegroom varies from 18 to 22, and of the bride from 16 to 20. The result of inquiries tends to show that there is a slight predominance of female over male births; three or four is the average number of children born of the same parents. The largest family known consisted of six, three only of whom attained maturity.[1]

2. Twins are rare, and as no instance can be recalled of both surviving infancy, notwithstanding all possible care being bestowed on them, they are not favourably regarded. No case of triplets has been known to occur. Births out of wedlock are considered discreditable, and in the one known instance of the kind, the parents were married immediately after the event; no difference was made in the treatment which the child received.[2]

3. The limited fecundity of the women may in some measure be due to the circumstance that they never wean their babies, so long as they are able to suckle them, and it not unfrequently happens that the two youngest children are seen together at their mother's breast.[3]

4. The ill success in rearing their offspring is doubtless owing in most part to the injudicious management and petting which each of the mother's friends considers right to bestow on the infant. It is looked upon as a compliment for every woman who may be nursing, to relieve the mother of this duty at frequent intervals; it is, therefore, no matter of surprise that the little one ails and dies.

5. The proportion of deaths from violence and accident, is believed to amount to four or five per cent.

6. Barrenness is rare, as are also cases of stillborn children. No drugs or other contrivances are employed in order to increase or limit reproduction.

Abnormalities.—1. Excessive development of fat about the gluteal region is frequently observable among the adult women.

[1] It is said that more children are born during the rains than at any other season of the year.

[2] *Vide post* "Marriage," paragraph 4.

[3] On this subject Dr. Brander remarks as follows:—

"They mostly possess considerable mammary development, and the glands in many cases seem to be in a chronic state of functional activity. This may be due to the late period to which they suckle their young (even to three or four years), or to another purpose to which the milk is applied. . . ." (*vide post*, "Sharing.") [As will be seen from Plate II, fig. 1, the mammæ are pyriform rather than spherical: with the advance of years they become flaccid and elongated.]

145 582 to about 60 to 65, if he reaches "old age." Except as to marriage at an earlier age, about 18, these figures apply fairly to the women also, who, however, live somewhat longer than the men, retaining in old age both health and mental faculties.

163 [853] **Reproduction.**—The marriages are infructuous, though barrenness is uncommon, a couple rarely producing families of even moderate size and many none at all. The child-bearing age is from 16 to 35; weaning is much delayed.

291 147 **Endurance.**—Left to themselves the Andamanese go stark naked and with head uncovered, except that the women wear, as clothing and not ornament, one or more leaves in front and a bunch of leaves tied round the waist behind, or a tassel of leaves all round. Jarawas, however, of both sexes have been seen entirely naked. They dislike and fear cold, but not heat, though they avoid exposure to the sun; and being accustomed to gratify every sensation as it arises, they endure thirst, hunger, want of sleep, fatigue and bodily discomfort badly. Want of sleep, such as occurs at their dances for occasionally as much as four days and nights, exhausts them greatly. A man's load is 40 lbs. and his distance 15 miles for a day or two only. After that he will rest, whatever the urgency. [482]

252 262 **Food.**—The food consists of fish, pork, turtle, iguana, "wild cat" (*paradoxurus sp.*), shell-fish, turtle eggs, certain larvæ, and a great variety of fruit, seeds, roots, and honey, and is plentiful both by sea and land. They never starve, though they are habitually heavy eaters. The food is always cooked and commonly eaten very hot. As much as possible of an animal is eaten and the Andamanese, like most hunters, have found out the dietary value of tripe. The Andamanese are expert cooks and adept at preparing delicacies from parts of animals and fish.

142 **Skin.**—The skin, which is smooth, greasy and satiny, varies in colour from an intense sheeny black to a reddish brown on the unexposed parts and also on the collar bones, cheeks and other prominences of the body. Its general appearance has been likened to a "black-leaded stove." The scalp, the lips and nostrils are black, and there are black patches on the palate. The soles of the feet are brownish yellow. The Bojigngiji Group (South Andaman) are the darkest, and among the Onges parts of the face are a light reddish-brown. The Jarawas are distinctly fairer than the rest, the general colour being a deep reddish brown. Leucoderma occurs on the fingers and lips.

Hair.—The hair varies from a sooty black to dark and light brown, yellowish brown and red. The general appearance of it is sooty black or yellowish brown. Except on the head the hair is scanty, but not absent: on the head it grows in small rings, which give it the appearance of growing in tufts, though it is really closely and evenly distributed over the whole scalp. Limited baldness is unknown, but temporary general baldness after disease occurs with a weak growth of the hair afterwards. The hair is not shaved, except on the head and eyebrows, and each tribe has, with many fantastic individual variants, its own method of wearing it. It turns grey at about 40, but white hair is not common. [302] [145]

Shaving is "woman's work" and was performed by small flakes of quartz, but nowadays flakes from the kicks of glass bottles are substituted. It is effective and close, but a painful operation on an European's face, as I proved by personal experience many years ago.

Bodily Parts.—The mouth is large, the palate hard and highly arched, the lips well formed. The hands and feet are small and well made. The ears are small and well shaped, the eyes are generally dark to a very dark brown, bright, liquid and clear, but prominent with slightly elevated outer angles and become dulled with age. The teeth, in the young, except amongst the Onges, are white, good and on the whole free from disease. Those of the Onges are irregular and discoloured. As age advances the teeth generally lose their whiteness and become worn, but without much caries. The teeth are roughly used without any care whatever. Dentition is early.

164 **Diseases.**—The muscular strength of the Andamanese is great, but their vitality is nevertheless low, and the apparently robust quickly die after sickening
